Quick disclaimer

All contents in this guide are probably *not* mathematically correct because I'm stupid. Hopefully it's accurate... There are many formulas in here, and I have tried my best to make them realistic and correct to what math currently suggests. I obviously could get multiple things *waaaaaay* wrong, but i tried... Thanks for checking out this guide, as it took quite a few hours of work to make, and a ton of time to calculate everything.

Debbreviation is a notation designed *specifically* to handle unimaginable numbers, mimicking the EternityNum notation found in many Roblox incrementals.

It is not recommended at all to be used in real life (why would you anyways lmao)

Section 1 - Intro to debbreviation

Debbreviation was made because current notations suck and are hard to remember. Debbreviation uses a simple pattern to make an easy to remember notation experience.

Formatting

Here are some examples of the ways that debbreviation should be formatted:

Incorrect format:

a99, 999,999a or 9.99,99a

Correct format:

99a, 9.99a, 34bcd

Rules: Numbers always come before letters. Capitalization should be mainly in lowercase, but can be made uppercase if there are readability issues. The only exception to this rule is that if the abbreviation is accompanied by other letters, it can then be capitalized. (ex. I got 4.6Bth place in the race) More rules and formulas can be found in other sections later in the document. If notations become too big, you can always see the Reduction section (decimal reduction, derepetetives, etc.)

Simple explanation

Most of the explanation behind the notation can be seen in this image below:

When you are using debbreviation, a number would start like this:

1
10
100
1a (1,000)

If you continued to count, the numbers would look like this:

10a	10b	10c	10d
100a	100b	100c	100d
1b (1,000,000 - otherwise known as 1m/1 million)	1c (1,000,000,000)	1d	1e

Using debbreviation in math

There are also multiple methods to use debbreviation with simple operators, such as (+ - * /) addition, subtraction, multiplication, and division.

Addition formula

1a + 3 = 1.003a	Examples:	1.000b = 1,000,000
1b + 3 = 1.000003b		^^^ You may need to add decimals to solve these.
or 1.0(5)3b (see decimal reduction)		1.000a = 1,000 <<< Add as you always would.

Adding is simple when using smaller numbers, but larger numbers such as 2.3aenfj could cause a lot of decimals, requiring a method of decimal reduction to be used.

Subtraction formula

1.000a - 3 = 997 <<< do it as you would normally
 1.000b - 3 = 999.997a <<< use a paper to think it out
 ex: 1.000b is 1,000,000 so that + -3 = 999,997 -> 999.997a

Using debbreviation to subtract may become a problem if there are too many decimals, for example, 1df (110 zeroes) - 1 would end up with something extremely large, like 9.999...999de (109 nines). To solve this, you can use decimal reduction (find in headers)

Multiplication formula

You should memorize the alphabet if you want to multiply.

$1a * 3 = 3a$ <<< simple mental math

$1a * 1b = 1c$ <<< add the letters (see alphaddition)

$1r * 2a = 2s$ <<< combine the two methods

This formula may be hard for anyone to understand. If you want to learn how to “add letters,” see alphaddition. Multiplying debbreviation is much easier using alphabet calculators..

Division formula

Dividing also requires memorization of the alphabet.

$1a / 2 = 500$ <<< simple math

$1b / 1a = 1a$ <<< subtract the letters (see alphatraction)

$12c / 3b = 4a$ <<< combine the two methods

Section 2 - Whole new math

Reduction

Everybody hates long decimals and big letters. There are multiple methods to fix these issues, which are very common when calculating debbreviation.

Decimal reduction

Disclaimer: Rounding is a hell of a lot easier, and recommended against all methods described in this section.

Sometimes decimals get in the way, so let's fix that! Here is an example of decimal reduction:

Decimal reduction

Examples:

1.99994h -> 1.9(4)4h

1.75800000045zd -> 1.7580(6)45zd

(This is the most effective method.)

During this process, replace large numbers with the number there is a large amount of, and then in parenthesis, type the amount of that number there are. This helps with especially big numbers that have up to 5dehg of a number at once. 1.56(5dehg)78ghxji. There can also be double, triple, quadruple, quintuple, or even 9HJXuple decimal reduction. An example is below:

1.5668(3.5(12)6gh)764hdjasccv

If too much reduction scares you, don't worry! Reduction is completely optional, especially because it is so hard to understand in extreme circumstances. You will rarely ever deal with numbers as large as the ones shown in examples above.

Letter reduction/Derepetetives

Note (this document refers to derepetitives as letter reduction, since it is much more convenient to read and type.

In very rare cases, there may be a number that looks like this:

1.32aaaaaaaaaaaaaaaaaaaaaaaaabcfsssss

(That's 896 zeroes!!) If this number scares you, that's justified. There's an easy solution to this though: Take a quick look at the example below:

1.32aaaaaaaaaaaaaaaaaaaaaaaaabcfsssss

1.32a(21)bcfs(6)

As you can tell, just like decimal reduction, there is the letter, and the amount. You most likely won't need to use double letter reduction, let alone triple, but an example is provided - just in case.

3.4a(4.5a(3)bc)bcd

If you ever see a number *this big*, run away immediately. That's probably 5g zeroes...

Letter formulas

Can't figure out how to solve debbrevation multiplication? Well that's alright, because this section is just for you.

Letter to number conversions

This figure image will show you what letters equal what numbers:

Letter to number conversions:

a=1		
b=2	k=11	u=21
c=3	l=12	v=22
d=4	m=13	w=23
e=5	n=14	x=24
f=6	o=15	y=25
	p=16	z=26
g=7	q=17	
h=8	r=18	
i=9	s=19	
j=10	t=20	
k		

Expanded letter to number is below.

Calculating letter values

***This section is VERY advanced, even I don't know what this means anymore!! Good luck
It's similar to polynomial division, almost***

Letter values are the number assigned to a letter. Act as if a number will spawn the letter that goes with it. This number will always be assigned to that letter (assuming you calculated correctly).

Here is how to calculate the value of a letter:

Calculate the value of letters

a = 1, it is the first abbreviation letter

a[var1] = 26, it is one alphabet through

a[var2] = 676 (26^2), it is two alphabets through

a[var4] = 456.976a (26^4), it is four alphabets through
and so on

Example - multiple var

ab - since there is a[var1] we have 26, and add 1 since it is b
(a would add zero.)

abc - since there is a[var2] we have 676 (26^2), and b is a
25 (minus 1, a would subtract zero). there is b[var1] so we
have 25^2 , which is 625. add 676+625 to get 1.301a, and
then add the c (+3, only the last digit will a add 1) to get
1.304a as the assigned value to abc.

If we use this formula for abcd,

a[var3] is $26^3 = 17.576a$

b[var2] is $25^2 = 625$ - total 18.201a

c[var1] is 24, add that to total to get 18.225a

d is 4, so our total is 18.229a

(this is very complicated, there aren't many better ways to
explain this, sorry)

abcd is the most comprehensible explanation to this, btw

If you didn't catch the whole [var{NUM}] thing, basically the NUM is the amount of letters after the selected letter, if that makes any sense. [var] is the letter, and NUM is the amount of letters behind it.

Adding letters/Alphaddation

Letter calculators recommended

Note: This guide refers to alphaddition as adding letters for convenience for the reader and writer.

Adding letters is simple up to adding j+p (10+16) or t+f (20+6) <- those both equal z
Examples:

Adding letters

g+h=o (7+8=15)

j+v=ai (10+25=35) (see expanded
L2N)

Adding letters is pretty easy to do compared to calculating letter values. Don't worry, subtracting letters is too.

Subtracting letters/Alphatractation

Letter calculators recommended

Note: This guide refers to alphtraction as subtracting letters for convenience for the reader and writer.

Subtracting letters is easy, just like adding them.

Subtracting letters

$$w - v = a \text{ (23-22=1)}$$

$$d - m = \#UND \lll \text{ negatives do not work in debbbreviation}$$

Yep, that's pretty much all there is to this.

Negatives

Unfortunately, there is a large downside to debbbreviation. That is that negatives do not work. Since debbbreviation is conceptually "infinite," making a negative would be impossible to calculate. This is because the negatives would require reversing the order of the debbbreviation, but since the universe as we know it could not fit such a large number inside of it, we would instead have to create a whole new system to incorporate negatives. Along with that, the negatives would reverse all formulas that are mentioned inside of this guide, which is also impossible due to the large amounts of formulas that would be broken in the process. It would also ruin how mathematically correct the abbreviation is at this point.

TL;DR - I'm too lazy to create a section for negatives

Section 3 - Extra information

Letter to number v2 (-1)

This L2N is the same as the original except that a=0 and z=25, and so on.

L2N - v2/extended (a=0)

a=0		r=17
b=1	j=9	s=18
c=2	k=10	t=19
d=3	l=11	u=20
e=4	m=12	v=21
f=5	n=13	w=22
g=6	o=14	x=23
h=7	p=15	y=24
i=8	q=16	z=25

Letter to number v3 (+26)

This is also the same but a=26 and z=51

L2N v3/extended (+26)

a=26	k=36	
b=27	l=37	u=46
c=28	m=38	v=47
d=29	n=39	w=48
e=30	o=40	x=49
f=31	p=41	y=50
g=32	q=42	z=51
h=33	r=43	
i=34	s=44	
j=35	t=45	

Extended letter to number

Note: All of this table was calculated using the formulas mentioned in the “Calculating letter values” section of this guide.

Extended	L2N
<i>Debbreviation Letters</i>	<i>Letter Value</i>
aa	27
ab	28
ac	29
ad	30
ae	31

aaaa	18.279a
a(5)	12.356b

Words with a number value

dog = 921

Explanation:

d[var2] - 30^2 = 900

o[var1] - 14 - total 914

g - 7 - total 921

gate = 33.494a

Explanation:

g[var3] - 32^3 - 32.768a

a[var2] - 26^2 - 676 - total 33.444a

t[var1] - 45 - total 33.489a
e - 5 - total 33.494a

shelf = ~3.783c

Explanation

s[var4] - 44^4 - ~3.748c
h[var3] - 33^3 - 35.937a - total ~3.783c
Total stays ~same

Section 4 - The end

Thanks for reading through this guide! I hope this gave you something to do for a few minutes and something to think about for a day or two. If you want to contact me, do it on Discord -> @cinnamongold
